It is commonly understood that the foundation of private instrumental studies at the collegiate level is one, hour-long, teacher-guided private lesson per week followed by self-guided student practice until the next lesson. This model allows a teacher to tailor instruction to fit a student's particular needs, however, because the majority of a student's time with an instrument is during self-guided practice, there are unique challenges that must be addressed. Students must recognize key concepts from a private lesson, know how to produce desired results technically, devise a strategy that will solidify key concepts in familiar and novel domains, and demonstrate their success in the next week's lesson. However, the processes involved in skill acquisition transcend domain and have been studied both in musical and non-musical contexts. In this research I will observe and compare the behaviors of students during private lessons with students' behaviors during subsequent self-guided practice sessions. The purpose of this study is to: 1. Determine if there is a measurable difference in student behavior during a private lesson and during a self-guided practice session. 2. Identify factors that mediate differences, if present. 3. Determine if accumulated lessons affect self-guided student practice. 4. Provide insight as to why different behaviors occur by comparing the findings from each student. A series of three private lessons and three subsequent student practice sessions from three students were video taped and analyzed, and after all video data were collected, an exit interview was conducted with each student participant. Descriptive statistics from each private lesson were compared with descriptive statistics from each self-guided practice session, and responses from the student exit interview were used to add additional insight to this comparison. It was found that there are measurable differences between student behavior during a private lesson and during a self-guided practice session. The results indicated that specific performance directives during a private lesson translate into self-guided student practice behaviors that are more focused and productive. Further research is needed to explore the effect of varying types of feedback during a private lesson on self-guided student practice. The results do not suggest that accumulated lessons affect self-guided student practice; however, it is likely that observations over a longer period of time would affect that result. The data show that further research is needed to provide insight as to why different behaviors occur among students, but the data suggests that individual differences between students is the primary cause of differing behaviors.

Perspectives on Transitions in Schooling and Instructional Practice examines student transitions between major levels of schooling, teacher transitions in instructional practice, and the intersection of these two significant themes in education research. Twenty-six leading international experts offer meaningful insights on current pedagogical practices, obstacles to effective transitions, and proven strategies for stakeholders involved in supporting students in transition. The book is divided into four sections, representing the four main transitions in formal schooling: Early Years (Home, Pre-school, and Kindergarten) to Early Elementary (Grades 1-3); Early Elementary to Late Elementary (Grades 4-8); Late Elementary to Secondary (Grades 9-12); and Secondary to Post-Secondary (College and University). A coda draws together over-arching themes from throughout the text to provide recommendations and a visual model that captures their interactions. Combining theoretical approaches with practical examples of school-based initiatives, this book will appeal to those involved in supporting either the student experience (both academically and emotionally) or teacher professional learning and growth.

The purpose of this study was to evaluate the effects of strategy-based instruction and guided practice on second grade students' fluency of basic addition facts. Baseline data were collected from three pretests to determine what strategies students were using to solve addition facts. How many facts they had achieved automaticity with, and at what rate they were solving facts. Each lesson in the treatment included direct instruction of basic addition fact strategies and guided student practice. At the conclusion of the treatment period posttests were administered to the subjects. Findings suggest that strategy-based instruction and guided practice did increase the computational fluency of my second grade students.
